# Overview

## 1 Graph Searches

# What's in a graph ?

## Graph

We consider non-oriented, simple and **connected** graphs

INCLUDE GRAPHS EXAMPLES AND COUNTEREXAMPLES

# Generic Search

```
for i in [1, ..., n]:  
    if i == 1:  
        u = any vertex  
    else:  
        u = any unvisited marked vertex  
    visit(u)  
    for v in neighbours(u):  
        mark(v)
```

# Another Characterization

Let's number vertices in the order they are visited.

## Theorem

*An order  $\sigma$  corresponds to a Generic Search if and only if*

$$\forall a <_{\sigma} b <_{\sigma} c, ac \in E \text{ and } ab \notin E, \exists d <_{\sigma} b \text{ st } db \in E$$

## DFS

INCLUDE GRAPH EXAMPLE

```
for i in [1, ..., n]:  
    if i == 1:  
        u = any vertex  
    else:  
        u = any unvisited vertex w/ max label  
    visit(u)  
    for v in neighbours(u):  
        label[v] = i
```

# Another Characterization

## Theorem

*An order  $\sigma$  corresponds to a DFS if and only if*

$$\forall a <_{\sigma} b <_{\sigma} c, ac \in E \text{ and } ab \notin E, \exists a <_{\sigma} d <_{\sigma} b \text{ st } db \in E$$

# BFS

```
for i in [n, ..., 1]:  
    if i == n:  
        u = any vertex  
    else:  
        u = any unvisited vertex w/ max label  
    visit(u)  
    for v in neighbours(u):  
        if v has no label:  
            label[v] = i
```

INCLUDE GRAPH EXAMPLE

# Another Characterization

## Theorem

*An order  $\sigma$  corresponds to a BFS if and only if*

$$\forall a <_{\sigma} b <_{\sigma} c, ac \in E \text{ and } ab \notin E, \exists d <_{\sigma} a \text{ st } db \in E$$

# Let's rewrite BFS

```
for i in [n, ..., 1]:  
    if i == n:  
        u = any vertex  
    else:  
        u = any unvisited vertex  
           w/ max first element of label  
    visit(u)  
    for v in neighbours(u):  
        label[v].append(i)
```

INCLUDE GRAPH EXAMPLE

# Here is LexBFS

```
for i in [n, ..., 1]:  
    if i == n:  
        u = any vertex  
    else:  
        u = any unvisited vertex  
           w/ max lexicographical label  
    visit(u)  
    for v in neighbours(u):  
        label[v].append(i)
```

INCLUDE GRAPH EXAMPLE

# Another Characterization

## Theorem

*An order  $\sigma$  corresponds to a LexBFS if and only if*

*$\forall a <_{\sigma} b <_{\sigma} c, ac \in E \text{ and } ab \notin E, \exists d <_{\sigma} a \text{ st } db \in E \text{ and } dc \notin E$*
